

App Store submission packet — Galaxy Sports Edge for iOS

Everything in this document is copy-pasteable into App Store Connect. Where a field has a non-obvious answer, the guideline that forces it is named, so a future reviewer can check the answer rather than trust it.

1. Identity

Field	Value
App name (30)	Galaxy Sports Edge
Subtitle (30)	Sports intelligence, auditable
Bundle ID	<code>com.galaxysportsedge.app</code>
SKU	<code>GSE-IOS-001</code>
Primary category	Sports
Secondary category	News
Price	Free (subscriptions via IAP)
Age rating	17+ — see §4

Why the subtitle is not “We’re not AI. We’re math you can read.” That line is 44 characters and would be truncated to nonsense at

30. More importantly, the positioning line is the *hypothesis*;

the subtitle has to say what the product does. The line appears in the first screenshot instead, where it has room to be read.

2. Description

Galaxy Sports Edge is a sports intelligence terminal. It publishes what a deterministic factor model finds, and — the part nobody else shows you — what it passed on and why.

We're not AI. We're math you can read.

WHAT YOU GET

The board. Three lanes: what the engine is scoring right now, what it published, and what it gated. "Gated" is not an error state. It is the product. Most days the model finds fewer than five edges, and some days it finds none.

Every pick carries its reasoning. The factor breakdown, the market-implied probability computed from the books' own quoted prices (arithmetic you can redo by hand), the edge estimate, the data quality score, and when the numbers were last refreshed.

The record, published in full. Wins, losses, pushes and voids, with a calibration curve that shows whether higher confidence actually wins more often. When it does not, the app says so on the calibration screen.

Loss autopsies. Every losing pick gets one. The cause is named in the product's own voice, not explained away.

WHAT IT DOES NOT DO

It does not take bets. It does not hold funds. It does not place wagers on your behalf. It does not share revenue with a sportsbook for sending you to one. There is no "bet now" button and no sportsbook checkout.

It is not a tout service. There is no lock of the day, no guaranteed winner, no win-rate banner before that rate has been earned.

WHAT'S FREE

The board, the full published record, the calibration curve and the Edge Index are public and stay public. A subscription adds the analysis behind them and the tooling that uses them.

SUBSCRIPTIONS

Pro and Elite are available as auto-renewing subscriptions. Payment is charged to your App Store account. Manage or cancel any time in your App Store account settings.

Copy rule compliance. This description was written against docs/positioning.md § "What Not To Say": no "AI-powered" or any variant, no "Mission Control", no "unlock your", no certainty

language, no competitor named. `scripts/lint-rules.js` covers the same vocabulary in-app and the description is checked by the same list in review.

3. Keywords (100 char limit)

sports analytics,picks tracker,calibration,track record,closing line
value,betting research

Deliberately absent: bet , betting tips , lock , guaranteed , win rate , sportsbook ,
odds bonus . Two reasons: they attract the audience the product rejects, and several are themselves
a review risk on a 17+ app.

4. Age rating questionnaire — exact answers

Question	Answer	Why
Cartoon or fantasy violence	None	—
Realistic violence	None	—
Profanity or crude humour	None	—
Alcohol, tobacco, drug references	None	—
Mature/suggestive themes	None	—
Horror/fear themes	None	—
Medical/treatment information	None	—
Gambling	Frequent/Intense (simulated)	The app discusses sports betting markets, references sportsbook odds, and reports on betting decisions. It does not offer real-money gambling.
Contests	None	No contests in v1.
Unrestricted web access	No	Every outbound link goes to an allow-listed URL from <code>src/lib/disclosures.ts</code> . There is no address bar and no arbitrary navigation.
User-generated content	None	No UGC in v1.

Resulting rating: 17+. Declaring the Gambling descriptor is not optional here: the app discusses markets and quotes odds, and the honest rating is what keeps the listing defensible.

Why `LSApplicationQueriesSchemes` is empty in `app.json` — the app opens no other app’s scheme. Specifically, it opens no sportsbook app and contains no deep link to one. An app that can `canOpenURL` a sportsbook is a different review conversation, and this one deliberately is not.

5. App Privacy — “Data Not Collected”? No. Exact answers.

The app does no cross-app or cross-site tracking. `NSPrivacyTracking` is `false` and `NSPrivacyTrackingDomains` is empty. Because of that, the app never shows an ATT prompt — and there is a test asserting that `expo-tracking-transparency` is not in the plugin list.

Data type	Collected	Linked to identity	Used for tracking	Purpose
Email address	Yes	Yes	No	App functionality — account and sign-in
User ID	Yes	Yes	No	App functionality — entitlements
Purchase history	Yes	Yes	No	App functionality — subscription state
Product interaction	Yes	No	No	Analytics + app functionality
Crash data	Yes	No	No	App functionality
Device ID	Yes	No	No	App functionality — push delivery

Deliberately absent: precise or coarse location, contacts, photos, health, financial info, browsing history, search history, advertising data, and any data used for third-party advertising.

Required-reason API declarations (in `app.json` → `ios.privacyManifests`):

API category	Reason code	Justification
UserDefaults	CA92.1	Preferences: reading mode, sport filter, haptics.
File timestamp	C617.1	The response cache records when a payload arrived; the age is displayed on screen.
Disk space	E174.1	The cache checks available space before writing a board.
System boot time	35F9.1	Elapsed-time measurement for the freshness budget.

6. App Review notes

Galaxy Sports Edge is a sports analytics and research app. It is NOT a sportsbook, and it does not offer, enable or facilitate real-money gambling.

ACCESS FOR REVIEW

The board, the published pick record and the calibration curve are fully public and require no account, no purchase and no promo code. Complete the age acknowledgement on first launch – it is a statement, not a date-of-birth field, and it takes one tap – and the board loads immediately.

To exercise the subscription screens: any Pro or Elite button opens the standard StoreKit sheet and can be cancelled without charge. The "Restore" button is present and functional.

DEMONSTRATION OF THE 3.1.1 REQUIREMENT

All digital content is unlocked through In-App Purchase. There is no external payment path visible in a non-US storefront. In a US storefront a "purchasing outside the app" link may appear under the subscriptions, which opens Safari; this is offered in addition to IAP, never instead of it, and no content is gated on using it.

SIGN IN

Sign-in is optional and only two surfaces require it (watchlist and alerts). Apple sign-in is offered alongside Google. The age gate and the board are reachable without any account.

ACCOUNT DELETION (5.1.1(v))

Settings → Delete account. The screen states what is deleted (account, email, subscription link, watchlist, devices) and what survives the deletion (the published pick record, unlinked), before the user confirms by typing their email address.

GAMBLING ADJACENCY (5.3 / 1.4.3)

No bet placement. No wagering. No funds held. No sportsbook affiliate revenue. No deep link to a sportsbook app or site. The "How we make money" screen inside the app links to the same disclosure published on the website. Responsible-play tooling (session reminders, a loss cool-down, self-exclusion, and the National Problem Gambling Helpline at 1-800-GAMBLER) is reachable from More → Responsible play and is present on the onboarding flow.

PRIVACY

No tracking, no third-party advertising SDKs, no ATT prompt. The privacy manifest declares no tracking. The app stores appearance preferences and a labelled cache of the last board; both are described in-app under More → Data and privacy.

FEEDBACK

This is our first release. If any surface is unclear, the fastest fix is a note in the review feedback and we will ship an update rather than argue.

7. Screenshots

Required sizes: **6.9"** (iPhone 17 Pro Max class, 1320×2868) and **6.5"** (1242×2688). Optional but recommended: iPad 13".

Six frames, each with one line of copy. Ordered so the first two carry the positioning:

#	Frame	Overlay line
1	Board, showing the GATED lane prominently	"It says no more than it says yes."
2	Pick card, full anatomy	"Every pick carries its own evidence."
3	Calibration screen with the inverted verdict visible	"When it is wrong, it says so here."
4	Withheld notice	"We withhold rows we price worse than the book."
5	Honest empty state	"Some days there is nothing. We tell you that too."
6	Receipt / verify	"Every pick has a receipt you can check."

Frame 3 is the one that matters. Showing the product declaring its own failure is the entire positioning, and it is also the frame no competitor can copy without meaning it.

App preview video: 30s, per `hyperframes-cli`. Silent, captioned, no music bed that implies urgency.

8. Export compliance

`ITSAAppUsesNonExemptEncryption = false` in `app.json`.

Justification: the app uses HTTPS (exempt: standard encryption for data in transit) and HMAC-SHA256 for its own session tokens. It implements no proprietary or non-standard cryptography, and it does not provide cryptographic functionality to the user. That is the `false` answer, and answering `true` would add a year of annual self-classification reports for no benefit.

9. Submission commands (`asc`)

Run after an EAS build has uploaded and processed. `APP_ID` comes from

`asc apps list --output table`.

```
# 1. Confirm the binary is there and processed
asc builds list --app $APP_ID --output table | head -5

# 2. Stage the version: creates it, copies metadata forward, attaches the build
```

```

asc release stage \
  --app $APP_ID \
  --version "1.0.0" \
  --build $BUILD_ID \
  --copy-metadata-from "" \
  --confirm

# 3. Push the metadata (first release: fill each field)
asc localizations update \
  --version $VERSION_ID \
  --locale "en-US" \
  --description "$(cat docs/store/description.txt)" \
  --keywords "sports analytics,picks tracker,calibration,track
record,closing line value,betting research" \
  --support-url "https://www.galaxysportsedge.com/contact" \
  --whats-new "First release."

# 4. Validate before submitting – this catches the missing-icons and
#   missing-privacy-policy class of rejection before a human sees it
asc validate --app $APP_ID --version "1.0.0"

# 5. TestFlight first. Always TestFlight first.
asc publish testflight \
  --app $APP_ID \
  --build $BUILD_ID \
  --group "$BETA_GROUP_ID" \
  --test-notes "First build. Exercise the board, the pick detail, and the
account-deletion flow." \
  --locale "en-US" \
  --submit --confirm

# 6. Only then, review
asc review submit --app $APP_ID --version "1.0.0" --build $BUILD_ID --
confirm

```

Auth is not set up on this host. The `asc` CLI is installed, but no App Store Connect API key exists here and one cannot be created autonomously — it is bound to the owner's Apple account. See `asc-cli` skill § Auth Setup and produce a key at App Store Connect → Users and Access → Integrations → API Keys (App Manager role is sufficient for everything above).

10. Likely rejection risks, and what is already done about each

Risk	Guideline	Mitigation already in the build
“Repackaged website”	4.2	Native navigation, haptics, offline cache with a labelled age, Live Activity scaffold, push. Not a WebView.
Selling digital content outside IAP	3.1.1	StoreKit is the only in-app path; the US external link is additive and storefront-gated.
No Sign in with Apple	4.8	<code>usesAppleSignIn: true</code> , Apple offered alongside Google.
No in-app account deletion	5.1.1(v)	<code>app/settings.tsx</code> , typed-email confirmation, server route in <code>server-patches/</code> .
Gambling without licensing	5.3	No wagering, no funds, no affiliate revenue share, no sportsbook deep link.
Missing privacy manifest	5.1.2	<code>ios.privacyManifests</code> in <code>app.json</code> , with the four required-reason APIs declared.
Placeholder metadata	2.3	Every field in this document is final copy, not lorem.
Broken demo path	2.1	The reviewer path in §6 is a real, unauthenticated path to every screen.
