GALAXY SPORTS EDGE · OPERATING DOCUMENT

Social Media Playbook

The complete runbook for @GalaxySportsHQ - how the intel becomes posts, how the evidence gates every number, and how game night runs from first practice report to final grade.

VERSION 1.0 | OCT 8, 2026 | X / YOUTUBE / TIKTOK / IG

Owner: Garrett Baxley, Kingwood TX. Lead operator: Motif. Standing rule: nothing posts without Garrett's explicit approval. Internal document - pricing, methodology, and data sources stay behind the fence.

SECTION 1

How to use this playbook tonight

One operator can run the entire NFL content operation from this document. It assumes no prediction engine, no extra tools, and no second person. Everything needed for a game night is here: the voice rules, the evidence ladder, the clock, the checklists, and the exact post shapes.

The operation has three layers. The **intel corpus** (SiriusXM transcripts, YouTube sweeps, practice reports, line tracking) gathers what happened. The **evidence ladder** decides what is solid enough to say out loud. The **voice** decides how it sounds. A post ships only when all three layers agree.

> **The one-sentence doctrine:** Publish only what a Tier 1 or Tier 2 source (or a corroborated Tier 3 source) supports, say it the way Garrett would say it to a friend, and grade every call in public after the game - win or lose.

Tonight, in order

1. **Master brief first.** Read the consolidated brief (last night + today) before drafting anything. Conflicts between sources stay visible in the brief's conflicts register - never silently resolved.
2. **Game-night check at T-minus 75 minutes.** Inactives, late scratches, roof status, line move since the brief. Anything that changes a number gets re-checked against the ladder.
3. **Draft, gate, approve.** Every draft passes the voice gate (read-aloud test, Section 2) and the evidence gate (Section 3), then waits for Garrett's word. No exceptions, including replies.
4. **Live watch.** One post per genuine turning point, not per drive. The learning-loop note is written *before* kickoff (what we expect, quarter by quarter) so the post-game grade is honest.
5. **Grade at final.** Result post within 30 minutes of the final whistle: what hit, what missed, the record in units. Misses get the same prominence as wins.

> **Engine status, stated plainly:** As of Oct 8, 2026 the prediction engine cannot produce a verified play (database unreachable, pick worker unbuilt, nothing calibrated). Tonight's calls run on the intel corpus and are labeled that way. Section 9 gives the exact path and timeline to engine-powered picks. This playbook never dresses intel up as model output.

SECTION 2

The voice that wins: Garrett-human, not optimized

The account's early posts were accurate and boring - optimized shapes with no human in them. The fix is not more analysis. It is Garrett's own voice, studied from his Facebook timeline (2020-2026): a person talking *to* you, one vivid image, short bursts, dry understatement, honest stakes.

The ten voice rules

RULE	WHAT IT MEANS IN PRACTICE
1. Talk TO the reader	Open like a greeting, not a thesis. "Alright, Sunday." "Okay, real talk." "Six plays today." Never "The AFC West aerial funnel presents..."
2. One vivid image per post	The image does the work: "a refrigerator with the temperament of a toddler," "the loudest building in football." Adjectives never do a noun's job - no "massive," "insane," "elite."
3. Staccato bursts	Short declarative sentences. Fragments are fine. "Kelce eats the seam. Seattle eats the backup guard. Detroit eats the quarterback." Then stop.
4. Dry understatement	Let the reader laugh. "Bold strategy." Never explain the joke or punch down.
5. Blunt one-liners	Say the true thing plainly, inside the professional floor below.
6. Questions that answer themselves	"How do you block Hutchinson with that line? You don't."
7. Honest stakes	"Every one posted before kick. Every result posted after, win or lose."
8. Minimal captions	"This." "Relatable." Trust the reader; over-explaining is the machine tell.
9. Country-direct register	"Man" and "dude" as seasoning, never the meal. Never corporate.
10. Player-first lens	Garrett played the game. Respect the grind, love the dramatics.

The professional floor (never broken)

Numbers stay in the post. The work stays visible. No cursing. No financial-advice framing - results are stated in units, never dollars ($5 = 1 unit). No injury jokes, no trolling, no hashtags in replies, no em dashes. Banned AI tells: *delve, unlock, game-changer, "let that sink in," "nobody is talking about."* The slogan "WE DETECT. YOU DECIDE." is suspended - website background only, never in a post.

> **The read-aloud test:** Read the draft out loud. If it sounds like Garrett telling a friend about the game, ship it to the approval desk. If it sounds like a press release or a betting tout, rewrite it. This test outranks every other rule in this section.

SECTION 3

Six evidence tiers gate every number

Every fact that reaches the feed carries a tier. The tier decides what the fact is allowed to do. This ladder comes from the shadow decision architecture adopted Oct 8, 2026, and it is the account's defense against the two failure modes that kill sports accounts: repeating noise as news, and dressing opinion up as data.

TIER	SOURCE CLASS	WHAT IT MAY DO
1	Official league injury reports, official game books, verified on-site personnel	Primary evidence. May move a published number on its own.
2	Licensed tracking/contract feeds, official league syndication (nflverse/nflreadr class)	May move a published number on its own, within license terms.
3	Credentialed beat reporters, recognized correspondents	Evidence *only* with independent corroboration (a second Tier 1-3 source). Uncorroborated Tier 3 goes to the library, not the feed.
4	Market line movement, betting splits, odds drift	Context only. A line move is never proof of sharp action or value. Report the move; never cite it as the reason for a play.
5	Social aggregators, forums, unaccredited communities	Never a rationale. May trigger a verification check, nothing more.
6	Analyst prose, model summaries, generated text (including AI summaries)	Never evidence. Tier 6 text cited as a fact is an automatic kill (STOP-10).

Point-in-time discipline

A fact is only usable if it existed before the lock. Every note in the system carries three timestamps: when the event is valid (*valid time*), when we ingested it (*assertion time*), and the game's lock time (kickoff). The rule is mechanical: `assertion_time <= lock_time`, or the note is quarantined to the post-lock audit log. An injury report stamped after kickoff cannot justify a pre-game post, and a backtest that uses one is lying about its accuracy.

> **The three leakage traps:** (1) syndicators quietly rewrite pre-game inactive lists after kickoff - always join on assertion time, never on the current table state; (2) warehouse overwrites destroy audit history - notes are append-only, corrections are new rows; (3) a weather scrape from 11:00 PM cannot describe an 8:15 PM kickoff - the only valid weather is what was asserted at or before lock.

SECTION 4

The shadow rule: footnote, never headline

Situational adjustments - the QB change, the wind, the short week - are real but low-frequency and high-variance, and analysts systematically overreact to them. The architecture adopted Oct 8 keeps every unproven adjustment in a **shadow lane**: computed, footnoted, scored against reality, and forbidden from touching the published number until it earns its way out.

What the research says the effects actually are

SITUATIONAL FACTOR	MEASURED EFFECT	POSTING RULE
Starting QB change (elite to average backup)	Spread moves 3.5 to 7.0 points (Rosen 2026)	The one big lever. Name it, quantify it.
Non-QB starter injury (WR/RB)	Under 0.5 points per player, absorbed by depth	Say who is out; invent no point swing.
Bye-week rest (post-2011 CBA)	+0.15 points, statistically zero (Lopez & Bliss 2024, 5,260 games)	Never sell rest as an edge; already priced.
Mini-bye / short week	+0.08 points, not significant	Color, not a play driver.
High wind (15+ mph sustained)	Totals drop 1.8 to 2.8 points (Borghesi 2008)	Post the wind number, not a vibe. Dome = no weather post.
Extreme cold without wind	0.8 points or less on totals	Mention only with the actual temperature attached.
Transcontinental travel (modern era)	Under 0.4 points, fully priced	Story angle only. Never an edge claim.

The promotion gates (all four, no exceptions)

1. **Sample:** 100+ settled games scored out-of-sample from the shadow version's own run.
2. **Brier score:** 0.22 or better.
3. **Calibration (ECE):** 0.05 or better, Murphy reliability 0.05 or better.
4. **Stability:** Three consecutive passing runs, no changes in between.

> **Why the floor is 100 and not 15:** With only 13 settled games, even a perfect 13-for-13 record certifies a true error rate no better than about 21% at 95% confidence; one miss pushes the bound past 36%. Small samples can only flatter calibration, never prove it. Any proposal to "lower the floor to publish faster" is STOP-07 and ends the conversation.

Until a shadow adjustment clears all four gates, it appears only as a labeled footnote ("our uncalibrated lean, not a play") or not at all. The published number is the baseline. Always.

SECTION 5

The weekly machine

Content is researched before it is urgent. The week runs on a fixed clock so game day is an execution day, not a research day.

WHEN (CT)	JOB	OUTPUT
Nightly, 11:45 PM	SiriusXM Channel 87 on-demand pull	Play the episode first, then open the transcript panel (the button only works once playback starts), scroll to the bottom, extract. Priority voices: Jeff Mans, Jim Bowden. Capture confidence, disagreement, and who analysts trust or fear - not just facts.
Wed + Fri, 7:30 PM	YouTube sweep (~8 shows each)	Analyst takes logged to the weekly corpus; duplicates deduped by fuzzy title match.
Every 12 hours, Thu-Sun	Lines and props tracker	Multi-book spreads/totals, line movement, ticket-vs-handle splits, prediction-market prices, prop watchlist. Snapshots archived; tracker auto-disables after Monday night.
Saturday, ~8:00 AM	Weekly aggregate to Garrett	The full week's intel in one email - the raw material for his Saturday podcast. (~3 emails/week total; the podcast is his, NotebookLM-assisted.)
Sunday, 5:00 AM-12:00 PM	Live listen (only live day)	Report 1 at ~10:00 AM, Report 2 at 11:30 AM (game-time decisions only). Standing authorization to send both.
Saturday night	Engagement review	Per-post metrics pulled; content decisions follow the numbers. Standing baseline: single-stat nuggets win, all-caps announcements flop. Post less, measure more.

The one-note rule

Every situational fact enters the system as one immutable row: note ID, retrieval timestamp (UTC), validity window, game ID (`2026_05_TB_DAL`), player ID, entity confidence, source tier and name, speaker, source URL, the exact verbatim quote, corroboration link (mandatory for Tier 3), situation class, proposed deltas, and routing status (`LIBRARY_ARCHIVED`, `SHADOW_ELIGIBLE`, `ABSTAINED`). A note missing its timestamp, tier, or entity link does not exist. Raw transcript text never enters a model as a coefficient - transcripts produce discrete, verified state changes (a status flag flips) or nothing.

SECTION 6

Game-night runbook (copy-paste)

For Thursday, Sunday, and Monday night games. Times are Central, relative to kickoff (T).

Pre-game

- [ ] **T-24h:** Master brief read. Learning-loop pre-game note written: what we expect, quarter by quarter, and what would change our mind.
- [ ] **T-6h:** Practice/injury final check. Any Tier 1 status change triggers a brief addendum, not a quiet edit.
- [ ] **T-75m:** Game-night check - official inactives, late scratches, roof open/closed, wind (outdoor only), line vs the brief's number. Every delta re-tiered.
- [ ] **T-60m:** Drafts written, voice-gated, evidence-gated, queued for Garrett's approval. Nothing posts on a timer.
- [ ] **T-10m:** Card post live (approved only). Baseline number stated; any shadow lean labeled as a footnote.

Live

- [ ] Post on turning points only: scores that swing win probability, injuries to starters, coaching decisions the brief flagged in advance.
- [ ] Quote the pre-game note when the game follows it ("we wrote this at 6 PM") and when it breaks it. Both build trust; only one builds it honestly.
- [ ] Reply lane open: paste-ready replies in Garrett's voice, approval-gated like everything else. Mild controversy is fine when the numbers disagree with other analysts; cheap shots are not.

Post-game

- [ ] **Final +30m:** Grade post - every call, hit or miss, record updated in units. Own misses first if there are any.
- [ ] **Same night:** Learning-loop grade filed against the pre-game note. What the engine of record (even the human one) got right for the wrong reasons gets flagged, not celebrated.
- [ ] **Next morning:** Day brief staged with the grade, the updated record, and the next game's first intel.

> **Approval gates that never move:** X posts need Garrett's explicit word. Publishing anywhere needs his say-so. Spending his money needs his cap. Everything else in this runbook runs without asking.

SECTION 7

Templates that ship

Seven shapes cover nearly everything the account posts. Each pair shows the boring version and the Garrett-human version of the same information.

1. The game card

BORING

"Sunday card, all posted before kick: Kelce over 5.5 catches (-110). Seahawks over 2.5 sacks (-120). Chiefs ML."

HUMAN

"Six plays today, all before kick. Kelce's going to live in the middle of that Raiders zone all afternoon. Seattle's front gets a backup guard in the loudest building in football. And the Lions are about to ruin Bryce Young's whole night. Card:"

2. The primetime scene-setter

HUMAN (TONIGHT'S APPROVED DRAFT)

"Tonight: a rookie making his second career start walks into Jerry World. Mayfield's out 3-6 weeks. Across from him: Dallas just got All-Pro Tyler Smith back in the trenches, and CeeDee Lamb is coming off 17 catches for 189 - a career night. Dome. Prime Video. No excuses. Who's watching?"

3. Breaking news

BORING

"Per reports, [star] has been ruled out for Sunday's game. This significantly impacts the spread and total."

HUMAN

"Schefter: [star] is out Sunday. There goes half the survivor pools. Backup SZN starts now."

Templates that ship

4. Owning a miss

BORING

"Result: our under pick did not cash. Final score went over the total. Record updated."

HUMAN

"We had the under. It went over by the second quarter. Our model has been sent to the shadow realm. 0-1. Back tomorrow."

5. The quiet win

BORING

"ANOTHER WINNER! We told you! Kelce cashes easily! Who's tailing?!"

HUMAN

"We had Kelce over 5.5 before kickoff. He had 6 by halftime. Anyway."

6. The single-stat nugget (the account's best performer)

One number, one image, no preamble. The Oct 4 baseline is unambiguous: single-stat nuggets outperform every other shape; all-caps announcements are the worst. When in doubt, post the nugget.

7. The reply

Dry humor, light sarcasm, real human. Numbers stay. Never punch down, never troll an injury, no hashtags. Brevity is the craft, not a defect.

SECTION 8

Guardrails and failure modes

The stop list is the account's immune system. Any trigger halts the post, not the night.

STOP ID	TRIGGER	ACTION
STOP-01	Note has no verified UTC timestamp	Reject the note. An untimed fact cannot be proven to exist before lock.
STOP-02	Fact asserted after kickoff	Quarantine to the audit log. It can never justify a pre-game claim.
STOP-03	Ambiguous player/team match	Refuse the link. Wrong-player posts are the fastest trust-killer in the niche.
STOP-04	Source is Tier 4, 5, or 6	Library only. Market moves and analyst prose never rationale a play.
STOP-05	Tier 3 without corroboration	Block the delta. One beat writer is a rumor; two are a report.
STOP-06	Raw prose aimed at a model or a post	Halt. Narrative becomes a discrete verified claim first, or it becomes nothing.
STOP-07	Publish attempt below N=100 settled	Force lock. Small samples flatter; they never certify.
STOP-08	Live metric breaches Brier/ECE gates	Re-quarantine to shadow. The footnote lane is always open.
STOP-09	Fails 3-run stability	Reset the counter to zero. Consistency is the product.
STOP-10	Claim has no verifiable URL and date	Discard. Unverifiable means unpublished, however good it sounds.

Standing brand guardrails

Public surfaces show projections and rankings only - underlying data, metrics, signals, and methodology stay internal (this includes all Next Gen Stats material: reasoning fuel, never published, never named). Results are posted in units, never dollars. No "lock," no "can't miss," no certainty framing: every pick carries a stated probability and its uncertainty. The site never claims calibrated confidence the operation does not have - that copy is flagged for scrubbing as of this writing.

SECTION 9

The engine truth (as of Oct 8, 2026)

Three independent probes, all fail-closed. This is the verified state, stated once and without varnish:

COMPONENT	STATUS
Prediction database (Neon)	Unreachable from the operator environment - the credential was rotated after an October exposure and the replacement is Garrett's console tap, still owed. Even the question "what is in the database" cannot currently be answered.
Pick worker	A stub. No runnable prediction path exists; the only live computation is market de-vigging, which is arithmetic, not a model.
Calibration	Nothing is calibrated. The only measured Brier scores on record are worse than a coin flip, both on unmerged branches. The adjustment layer's own header marks every magnitude `calibrated: false`.
Public claims	The website still advertises "calibrated betting confidence." That is an overclaim against this table and is queued for a copy scrub.

> **What this means for the feed:** Until Section 10 lands, every play the account posts is an intel-corpus play - sourced, tiered, and reasoned, but not model output. Posts say so when it matters and never borrow the engine's authority. An honest "nothing verified tonight" beats a fabricated yes, including under deadline pressure. Especially under deadline pressure.

SECTION 10

Path to engine-powered picks

The shadow architecture assumes a publishing baseline the operation does not yet have - but it also permits the baseline to be closing market consensus, which the existing de-vig path already computes. That makes the sequence below a day-one start, not a rebuild.

STEP	BUILD	WHY THIS ORDER
0	Garrett's two Neon taps: credential rotation confirmed, access restored	Nothing downstream can be verified without database access. The only step that needs his hands.
1	`situational_notes` table (17-field schema, default-deny)	Every tier gate, as-of join, and delta proposal reads from this row. Without it, the rest is disconnected islands.
2	Market de-vig as baseline v0 (`y_pub`)	The architecture explicitly allows closing consensus as the unconditioned baseline. Real deltas can be shadow-scored against it immediately.
3	Shadow consumer live (footnote lane only)	Starts the 100-game clock. Every week of delay is a week added to the earliest honest publish date.
4	Walk-forward backtest: train 2022-2024, validate 2025, live-check 2026	Temporal honesty enforced by construction - no tuning on the games being scored.
5	Promotion review at the four gates	Brier, ECE, reliability, and 3-run stability decide. Not enthusiasm, not a hot streak.

The realistic timeline is days of build plus one season-fraction of shadow scoring - not tonight, and this playbook will not pretend otherwise. When the first engine-powered play does publish, it will carry its sample size and calibration state in the post. That transparency is the brand: the work, visible.

Sources consulted for this playbook: voice brief *Making @GalaxySportsHQ Sound Like Garrett* (2026-10-04, Facebook 2020-2026 study); the shadow decision architecture adopted 2026-10-08 (evidence tiers, bitemporal joins, shadow consumer gates); Lopez & Bliss (2024) on rest differential; Borghesi (2007, 2008) on weather and totals; Boulier & Stekler (2003) on forecast benchmarks; Rosen (2026) on quarterback spillovers; the account's own engagement baseline (2026-10-04). Several 2026-dated citations in the architecture document are under verification review as of this writing and are used here as method, not as settled literature - the measured effects above rest on the peer-reviewed studies.
